bernardo.fichera@epfl.ch

Spring Semester 2020

## 1 Introduction

The mini-project accounts for **50%** of the grade and entails either implementing an algorithm of choice and one or more variants from the following list, evaluating the algorithm's performance and sensibility to parameter choices, *or* preparing and presenting to the class a paper covering an advanced topic in machine learning.

Projects are assigned on a first come, first served basis. In-class reading of papers are done individually. Coding projects are done in a team of three. Teams should be formed and projects should be selected before **Tuesday, March 3rd 2020** through moodle.

Code and reports for the coding project and slides for in-class reading should be submitted through moodle

## 2 Coding mini-projects

- Groups of 3 students.
- Max 3 teams can potentially take the same coding project.
- Teams with the same coding projects have to use **different datasets**

**Implementation:** It should be handed in as a self-contained piece of **code** (coding language - matlab, python, C/C++) with corresponding demo scripts which analyze the use of the algorithm (selection of a dataset, systematic assessment of strength/weaknesses taking one algorithm as example, e.g. SVM or Boosting).

**Report:** The team should write a **report** (maximum 8 pages double column format). The results section should discuss important items, such as computation costs at training versus testing, growth of computational costs with dimension of dataset, number of hyper-parameters and how sensitive (if at all) the algorithm is to the choice of these hyper-parameters.

## Matlab toolboxes

Toolbox	URL
Matlab Toolbox for Dimensionality Reduction Statistics and Machine Learning Toolbox Least Squares - Support Vector Machine LIBSVM GMM/GMR v2.0	<a href="https://lvdmaaten.github.io/drtoolbox/">https://lvdmaaten.github.io/drtoolbox/</a> <a href="http://fr.mathworks.com/help/stats/index.html">http://fr.mathworks.com/help/stats/index.html</a> <a href="http://www.esat.kuleuven.be/sista/lssvmlab/">http://www.esat.kuleuven.be/sista/lssvmlab/</a> <a href="http://www.csie.ntu.edu.tw/~cjlin/libsvm/">www.csie.ntu.edu.tw/~cjlin/libsvm/</a> <a href="http://lasa.epfl.ch/sourcecode/?showComments=14#GMM">http://lasa.epfl.ch/sourcecode/?showComments=14#GMM</a> <a href="https://github.com/probml/pmtk3">https://github.com/probml/pmtk3</a>

<code>scikit-learn</code> . Machine Learning in Python <code>bnpyp</code> . Bayesian NonParametric Machine Learning for Python <code>GPy</code> Gaussian processes	<a href="http://scikit-learn.org/stable/">http://scikit-learn.org/stable/</a> <a href="https://bitbucket.org/michaelchughes/bnpy/">https://bitbucket.org/michaelchughes/bnpy/</a> <a href="https://github.com/SheffieldML/GPy">https://github.com/SheffieldML/GPy</a>

### 2.1 Dimensionality reduction / Manifold learning projects

1. Compare LLE to one of its 2 variants, MLLE or HLLE:

- **LLE** (Locally Linear Embedding)  
Roweis, Sam T., and Lawrence K. Saul. "Nonlinear dimensionality reduction by locally linear embedding." science 290.5500 (2000): 2323-2326.
- **MLLE** (Modified LLE)  
Zhang, Zhenyue, and Jing Wang. "MLLE: Modified locally linear embedding using multiple weights." Advances in neural information processing systems. 2007.
- **HLLE** (Hessian LLE)  
Donoho, David L., and Carrie Grimes. "Hessian eigenmaps: Locally linear embedding techniques for high-dimensional data." Proceedings of the National Academy of Sciences 100.10 (2003): 5591-5596.

All implementations are found in *scikit-learn* for python. LLE and HLLE are found in *drtoolbox* for MATLAB.

2. Choose 2 of the following methods and compare them:

- **SNE** (Stochastic Neighbor Embedding)  
Hinton, Geoffrey E., and Sam T. Roweis. "Stochastic neighbor embedding." Advances in neural information processing systems. 2003.
- **tSNE** (t-distributed SNE)  
Maaten, Laurens van der, and Geoffrey Hinton. "Visualizing data using t-SNE." Journal of machine learning research 9.Nov (2008): 2579-2605.
- **GPLVM** (Gaussian Process Latent Variable Models)  
Lawrence, Neil. "Probabilistic non-linear principal component analysis with Gaussian process latent variable models." Journal of machine learning research 6.Nov (2005): 1783-1816.

All implementations are found in *scikit-learn* and *GPy* for python and in *drtoolbox* and *GPmat* for MATLAB.

### 2.2 Clustering projects

1. Compare the 2 clustering methods:

- **Kernel K-means**  
Welling, Max. "Kernel K-means and Spectral Clustering." 2013-03-15]. <http://www.ics.uci.edu/~welling/teaching/273 ASpring09/SpectralClustering.pdf>. (Resource for the Advanced ML class)

- **SV Clustering** (Support Vector Clustering)  
Ben-Hur, Asa, et al. "Support vector clustering." Journal of machine learning research 2.Dec (2001): 125-137. (Resource for the Advanced ML class)

The implementation of Kernel K-means is found in the *ML toolbox* used in class and the implementation of SV Clustering is found in the *Support Vector Clustering Toolbox*, both for MATLAB.

## 2.3 Classification projects

1. Choose 2 of the following algorithms and compare them:

- **Logistic Regression**  
Morgan, S. Philip, and Jay D. Teachman. "Logistic regression: Description, examples, and comparisons." Journal of Marriage and Family 50.4 (1988): 929-936.
- **LDA** (Linear Discriminant Analysis)  
Balakrishnama, Suresh, and Aravind Ganapathiraju. "Linear discriminant analysis-a brief tutorial." Institute for Signal and information Processing 18 (1998): 1-8.
- **QDA** (Quadratic Discriminant Analysis)
- **GPC** (Gaussian Process Classification)  
Rasmussen, Carl Edward. "Gaussian Processes in Machine Learning." Advanced Lectures on Machine Learning (2004): 63.

All implementations are found in *scikit-learn* for python and in Mathwork's Statistical and Machine Learning Toolbox for MATLAB. The implementation of Logistic regression and LDA can also be found in the *pmtk3* toolbox for MATLAB. GPC is found at GPmat and GPy for Matlab and python respectively.

2. Compare the 2 ensemble methods:

- **AdaBoost**  
Freund, Yoav, and Robert E. Schapire. "A decision-theoretic generalization of on-line learning and an application to boosting." Journal of computer and system sciences 55.1 (1997): 119-139.
- **RTF** (Random Tree Forests)  
Breiman, Leo. "Random forests." Machine learning 45.1 (2001): 5-32.  
[https://www.stat.berkeley.edu/users/breiman/RandomForests/cc\\_home.htm](https://www.stat.berkeley.edu/users/breiman/RandomForests/cc_home.htm)

The implementation of AdaBoost is found in the *ML toolbox* used in class and RTF is found in the *pmtk3* toolbox for MATLAB. All implementations for python are found in *scikit-learn*.

## 2.4 Regression projects

1. Choose 2 of the following algorithms and compare them:

- **SVR** (Support Vector Regression)  
Drucker, Harris, et al. "Support vector regression machines." Advances in neural information processing systems. 1997.
- **GMR** (Gaussian Mixture Regression)  
Sung, Hsi Guang. Gaussian mixture regression and classification. Diss. Rice University, 2004.
- **LWPR** (Locally Weighted Projection Regression)  
Vijayakumar, Sethu, and Stefan Schaal. "Locally weighted projection regression: An O (n) algorithm for incremental real time learning in high dimensional space." Proceedings of the Seventeenth International Conference on Machine Learning (ICML 2000). Vol. 1. 2000.
- **GPR** (Gaussian Process Regression)  
Williams, Christopher KI. "Prediction with Gaussian processes: From linear regression to linear prediction and beyond." Learning in graphical models. Springer, Dordrecht, 1998. 599-621.

The implementation of all algorithms is found in the *ML toolbox* used in class (GMR found in *gmmbox*), for MATLAB. SVR and GMR are also found in *scikit-learn* for python. GP is found at GPmat and GPy for Matlab and python respectively.

### 3 In-class paper reading and presentation

The paper reading is worth 50% of the grade and consists in a 10-minutes presentation in front of the class, followed by 10-minutes questions. The list of papers is available in the following subsections, each paper can be assigned to only one person. Selection of papers is done on a first come first serve basis. Paper reading is done individually. Grades are based on the following criteria: Clarity of the slides (25%), clarity of the speech (25%), timeliness (10%), quality of answers to the questions (40%).

All papers refer partly to techniques seen in class and partly to techniques we have not seen. For instance, paper on learning metrics for semi-supervised clustering refers to linkage clustering, a technique not described in class. Paper reading is intended to introduce you to extensions to machine learning techniques seen in class. Moreover, as you present the paper in front of the class, this will enable the class to learn about these techniques. ***It is hence of utmost importance that your presentation of the paper be intelligible to the class!*** When presenting the paper, recall that the audience is only partly familiar with the material. Think that you are teaching this, this means that you must introduce the concepts in a very clear and didactic manner.

It is expected that you will read not only the paper you must present in class, but also related papers. For instance, if you are not familiar with some of the terms or techniques used in the paper, you should read the references provided in the paper. Do not stop at reading the summary of these techniques provided in the paper, as you must be able to explain these other techniques if asked! You may want to also search papers that use the technique developed in the paper you must read.

Finally, keep a critical eye and make sure to offer to us your personal opinion about the strengths and weaknesses of the work you have read, going beyond what the authors state themselves. Offer your opinion!
